

Alternate Design

When I originally designed this toy I viewed it as a push/pull toy, not necessarily a toy to be ridden. Because of a request by DIY to make this a riding toy, I am including a variation that makes it much more stable. I personally prefer this new version and will continue to make them this way in the future.

The only change is to the box, which is made four inches longer, and the sides of the cab which I will show here

The back of the newly designed cab will line up with the back of the elongated box, shifting the foot print out four more inches, making the train much less likely to flip over backward.

NOTE

As are all the designs listed here, this is an original design owned by the designer. It's inclusion here gives you the right to build it for yourself, but not to sale. Commercial use of these designs are prohibited.
